

Capstone Service Network

Now you can have Capstone monitor the performance of your Capstone MicroTurbine system(s) via the CapstoneServiceNetwork (CSN).

CSN

CSN is a web-based interface that provides a real time oversight of your microturbine(s) and, when contracted, the balance of plant (fuel treatment skids, pump operation, and other system devices). It's your personal Capstone control room that provides a real time, interactive view of your Capstone MicroTurbine equipment.

More importantly, if a trouble event occurs, CSN immediately identifies what's occurred when system performance is affected.

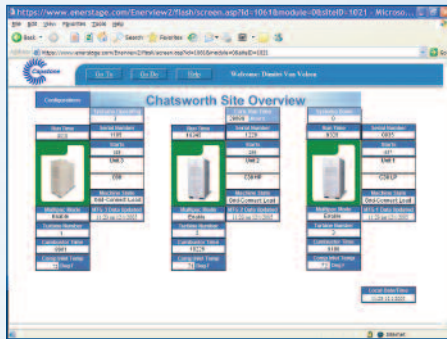

Your local Capstone Service Technician will be notified by phone, e-mail, or pager with the details so we can resolve the event and return your system to online status.

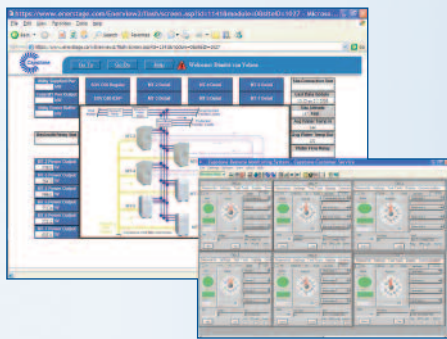

Capstone Service Network

KEY FEATURES

Data Logging & Storage

CSN monitors and records key data on the operation and performance of your microturbine(s) upon commissioning on a 24x7 basis.

ActiveAlert Realtime Notification

If there's ever a trouble event with one of your microturbines, CSN notifies your local Capstone Service Technician (CST) instantly.

It immediately provides all the critical data needed for your CST to return your system to online status.

Balance of Plant Interactivity

Optional ModBus interconnectivity enables CSN to monitor the operation of other elements of your on-site energy solution: from compressors, to air handlers to pumps, water flow and temperatures.
